## HARD PACKET 1

Team ID Number:

## Physical Properties

The Clausius Clapeyron Equation describes the relationship between vapor pressure and temperature:

$$
\ln (P)=-\frac{\Delta H_{v a p}}{R T}+C
$$

where C is constant at all temperatures; $\Delta \mathrm{H}_{\text {vap }}=40.65 \mathrm{~kJ} / \mathrm{mol}$.
Suppose there is a closed container of water at an external pressure of 1.0 atm . What is the vapor pressure of water at $90{ }^{\circ} \mathrm{C}$ ?

## HARD PACKET 1

## Equilibrium

A scientist is performing an experiment an unknown metal hydroxide, $\mathrm{X}(\mathrm{OH})_{3,}$, where X is an unknown metal. He finds that when $\mathrm{X}(\mathrm{OH})_{3}$ is completely dissolved in 0.010 M NaOH , the pH of the solution is 12.74 . What is the molar solubility of $X(\mathrm{OH})_{3}$ in pure water?

## Electrochemistry

A Galvanic cell $\mathrm{Cu}(\mathrm{s}), \mathrm{CuBr}(\mathrm{s})\left|\mathrm{Br}^{-}(1.0 \mathrm{M}) \| \mathrm{Cu}^{+}(0.10 \mathrm{M})\right| \mathrm{Cu}(\mathrm{s})$ at 298 K has a measured cell potential of 0.377 V . Given that the half-reaction:

$$
\mathrm{Cu}+(\mathrm{aq})+\mathrm{e}^{-} \rightarrow \mathrm{Cu}(\mathrm{~s}) \quad \varepsilon_{\text {red }}^{\circ}=0.522 \mathrm{~V}
$$

Calculate $K_{s p}$ for $\operatorname{CuBr}(s)$ at 298 K .

## HARD PACKET 2

Team ID Number:

## Physical Properties

Some scientists attempt to build a weather balloon filled with $\mathrm{CO}_{2}$ and $\mathrm{O}_{2}$. They fill the balloon with 11.5 L of $\mathrm{CO}_{2}$ gas at an initial pressure of 60.0 torr and 21.5 L of $\mathrm{O}_{2}$ gas at an initial pressure of 50.0 torr. Once fully expanded, the balloon occupies 33.0 L of volume. Assuming that the temperature of the gases remains constant and that the two gases behave ideally, what is the expected final pressure of the $\mathrm{CO}_{2}$ gas in this mixture?

## HARD PACKET 2

Team ID Number: $\qquad$

## Thermodynamics

On Planet Laberstros, the chemicals $\mathrm{O}^{\prime}$ and $U^{\prime}$ can combine into $\mathrm{O}_{2} \mathrm{U}^{\prime}$ by the following equilibrium process:

## Reaction 1:

$$
2 \grave{O}(\mathrm{aq})+\mathrm{U}^{\prime}(\mathrm{aq}) \not \geqq \mathrm{O}_{2} \mathrm{U}^{\prime}(\mathrm{aq})
$$

Scientists on Earth have compiled a table of useful information regarding these elements:

| $\Delta \mathrm{G}^{0}$ | $-16.5 \mathrm{~kJ} / \mathrm{mol}$ |
| :---: | :---: |
| Specific heat capacity of Ò | $\mathrm{C} 0=4.0 \mathrm{~J}^{\circ} \mathrm{C}^{-1} \mathrm{~g}^{-1}$ |
| Specific heat capacity of U' | $\mathrm{C}_{\mathrm{U}}=4.32 \mathrm{~J}^{\circ} \mathrm{C}^{-1} \mathrm{~g}^{-1}$ |
| Specific heat capacity of $\stackrel{O}{2}_{2} \mathrm{U}$ ' | $\mathrm{Co}_{\mathrm{o}_{2} \mathrm{U}}=4.3 \mathrm{~J}^{\circ} \mathrm{C}^{-1} \mathrm{~g}^{-1}$ |
| Heat capacity of water between $0^{\circ} \mathrm{C}$ and $100^{\circ} \mathrm{C}$, assume constant for all concentrations of solute | $\mathrm{C}_{\mathrm{w}}=4.184 \mathrm{~J}^{\circ} \mathrm{C}^{-1} \mathrm{~g}^{-1}$ |

The $\Delta \mathrm{G}$ value can be determined for any temperature using the following equation:

$$
\Delta \mathrm{G}(\mathrm{~kJ} / \mathrm{mol})=0.00072 \mathrm{~T}^{2}-0.008 \mathrm{~T}-78.05
$$

All of the chemicals are completely soluble in water. The solvation of all these chemicals is a very exothermic process. Below is a table of the enthalpy of solvation and molar mass for the chemicals:

| Chemical | $\mathrm{H}_{\text {solv }}(\mathrm{kJ} / \mathrm{mol})$ | Molar Mass $(\mathrm{g} / \mathrm{mol})$ |
| :--- | :--- | :--- |
| $\ddot{O}$ | -8.87 | 73.6 |
| $U^{\prime}$ | -7.32 | 145.6 |
| $\dot{O}_{2} U^{\prime}$ | -10.68 | 292.8 |

An Earth scientist adds 50.0 g of Ò, 50.0 g of Ư', and 50.0 g of $\mathrm{O}_{2} \mathrm{U}$, to 500.0 mL of water at 298 K and 1.0 atm . The chemicals dissolve completely in water. The scientist observes that the final volume of water is 600.0 mL . Assume that the density of the solution is approximately $1.0 \mathrm{~g} / \mathrm{mL}$. What are the concentrations of each chemical when the solution reaches equilibrium?

## HARD PACKET 2

Team ID Number: $\qquad$

## Chemical Reactions

The sequential redox reductions of vanadium are given below:

$$
\begin{aligned}
& 2 \mathrm{VO}_{2}^{+}(\mathrm{aq})+4 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{Zn}(\mathrm{~s}) \rightarrow 2 \mathrm{VO}^{2+}(\mathrm{aq})+\mathrm{Zn}^{2+}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
& 2 \mathrm{VO}^{2+}(\mathrm{aq})+4 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{Zn}(\mathrm{~s}) \rightarrow 2 \mathrm{~V}^{3+}(\mathrm{aq})+\mathrm{Zn}^{2+}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
\end{aligned}
$$

A bunch of scientists has a supply of 11.1 mL of a 0.0035 M solution of $\mathrm{VO}_{2}^{+}$and 0.0020 g of Zinc metal on hand. Determine if this amount of Zinc metal is enough to fully reduce all the $\mathrm{VO}_{2}{ }^{+}$. If it is not enough, how many more grams of zinc metal are required?

## Acid/Base

Phosphoric Acid, $\mathrm{H}_{3} \mathrm{PO}_{4}$, is a triprotic acid, which means that it can lose all three of its hydrogens. High school students perform a titration experiment, titrating 55.0 mL of $2.0 \mathrm{M} \mathrm{H}_{3} \mathrm{PO}_{4}$ with 1.0 M NaOH . Calculate the pH of the solution when 188.0 mL of NaOH is added.

$$
\begin{gathered}
\mathrm{K}_{\mathrm{a} 1}=7.5 \times 10^{-3} \\
\mathrm{~K}_{\mathrm{a} 2}=6.2 \times 10^{-8} \\
\mathrm{~K}_{\mathrm{a} 3}=4.8 \times 10^{-13}
\end{gathered}
$$

## Thermodynamics

Spaceships can use potassium superoxide to convert carbon dioxide into oxygen during long voyages. The balanced equation is given below:

$$
2 \mathrm{KO}_{2}(\mathrm{~s})+\mathrm{CO}_{2}(\mathrm{~g}) \rightarrow \mathrm{K}_{2} \mathrm{CO}_{3}(\mathrm{~s})+1.5 \mathrm{O}_{2}(\mathrm{~g}) \quad \Delta \mathrm{G}^{\circ}=-30 \mathrm{~kJ} / \mathrm{mol}
$$

NASA wants to use the energy generated by this exothermic reaction to help power the journey of the spacecraft. A grown adult creates about 1.0 kg of carbon dioxide a day, while a spacecraft needs about 55.24 W to maintain operation of electrical equipment in deep space. How many astronauts are needed to provide enough carbon dioxide to power the spaceship?
$\qquad$

## Kinetics

In an iodine clock experiment, students measure the time required for a mixture of two 0.080 M solutions, solution A and solution B, to change colors. In the first trial, the mixture had a total of 20.0 mL , composed of an equal mixture of solution A and solution B , and took 10 minutes to change colors. In the second trial, the mixture also had a total volume of 20.0 mL but was composed of 10.0 mL of solution $\mathrm{B}, 8.0 \mathrm{~mL}$ of solution A , and 2.0 mL of distilled water. Assuming that the speed of the reaction follows the formula rate of reaction $=\mathrm{k}[\mathrm{A}]^{2}[\mathrm{~B}]$, how long does it take for the second trial to change colors?
$\qquad$

## Thermodynamics

Recently, your friend Daniel has decided to gain a lot of muscle. However, he has resorted to fixing up his diet rather than exercising and is currently deciding what type of sweetener to place in his morning coffee. How much energy, in $\mathrm{kJ} / \mathrm{g}$, does the lowest calorie sweetener offer to Daniel's body? Assume Daniel's body is perfectly efficient and metabolizes everything into the component molecules' standard state without any loss of energy.

| Sweetener | Chemical Formula |
| :--- | :--- |
| 1. Glucose | $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$ |
| 2. Pyruvate | $\mathrm{C}_{3} \mathrm{H}_{4} \mathrm{O}_{3}$ |
| 3. Aspartic Acid | $\mathrm{C}_{4} \mathrm{H}_{7} \mathrm{NO}_{4}$ |

1.

2.

Chemical Formula
$\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$
$\mathrm{C}_{4} \mathrm{H}_{7} \mathrm{NO}_{4}$

2.

Use the following table to help answer this question:

| Bond | Energy (kJ/mol) | Bond | Energy (kJ/mol) |
| :--- | :--- | :--- | :--- |
| $\mathrm{C}-\mathrm{O}$ | 358 | $\mathrm{C}-\mathrm{H}$ | 413 |
| $\mathrm{C}=\mathrm{O}$ | 745 | N-H | 391 |
| $\mathrm{C}-\mathrm{N}$ | 293 | $\mathrm{O}-\mathrm{H}$ | 463 |
| $\mathrm{C}-\mathrm{C}$ | 348 |  |  |

## HARD PACKET 4

Team ID Number: $\qquad$

## Chemical Reactions

The Ostwald process is used to make nitric acid $\left(\mathrm{HNO}_{3}\right)$ from ammonia $\left(\mathrm{NH}_{3}\right)$. The first step produces one of the precursor reactants, nitric oxide ( NO ) and typically involves a metal catalyst. The first step of the unbalanced reaction is shown below:

$$
\mathrm{NH}_{3}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{NO}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{~g})(\text { for the balanced reaction, } \Delta \mathrm{H}=-905.2 \mathrm{~kJ})
$$

This reaction occurs only at a pressure between 4.0 atm to 10.0 atm and a temperature of 500 K . A 2.0 L rigid container is heated to 500 K . In the container, the partial pressure of both ammonia and oxygen is 1.5 atm while the partial pressure of an inert gas is 1.0 atm . When the reaction is complete, how much energy is evolved as heat? How much energy is evolved as work?

## HARD PACKET 4

Team ID Number: $\qquad$

## Electrochemistry

WUCT, the Washington University Chemistry Tournament, is petitioning WashU to cut the entire landscaping budget and delegate all horticulture duties to WUCT. Because WUCT cannot afford to buy water for the grass, the following half reaction will be used to generate water instead:

$$
4 \mathrm{H}^{+}+\mathrm{O}_{2}+4 \mathrm{e}^{-} \rightarrow 2 \mathrm{H}_{2} \mathrm{O} .
$$

To facilitate this reaction, liquid mercury (which for some reason is cheaper than water) is loaded into the sprinkler system and sprinkled onto the grass, providing the electron source for the water generating reaction using this half reaction below:

$$
\mathrm{Hg} \rightarrow \mathrm{Hg}^{2+}+2 \mathrm{e}^{-}
$$

Assume the concentration of mercury ions in WashU soil is at 1.0 M and that the temperature is 298 K . What is the highest pH WashU soil can have before this method is no longer a feasible way to produce any water?

## HARD PACKET 5

Team ID Number:

## Equilibrium

8.67 g of calcium oxide (CaO), a white powder, is dissolved in 500.0 mL of water under a certain condition. 6.48 g of a white precipitate form in the solution. What is the $K_{s p}$ of the white precipitate under these conditions?

## Electrochemistry

You've run out of aluminum foil while camping, but luckily you have a solution of aluminum nitrate and the supplies to set up an electrochemical cell (aren't camping chemists just the best?). Calculate the current (in Amps) you should use in your cell if you want to plate 100.0 g of Al in 210 minutes, so you can make dinner before the sun goes down.
$\qquad$

## Acid/Base

Hexaflurosilicic acid $\left(\mathrm{H}_{2} \mathrm{SiF}_{6}\right)$ is often added to water as a way to fluorinate the American water supply. This acid is very strong, and the first deprotonation goes to completion. The second deprotonation has a pKa of -0.45 . The salt of hexafluorisilic acid (e.g. $\mathrm{Na}_{2} \mathrm{SiF}_{6}$ ) will dissociate into 6 free fluoride ions, resulting in the fluoridation of the water. However, this reaction only occurs near neutral pH . If WUCT wishes to have 1.0 ppm fluoride ions in its 500.0 L drinking water (which they still can't afford) in environmentally friendly water bottles, how many grams of hexaflurosilicic acid should be added? What volume of 1.0 M NaOH should be added? (Note that $1.0 \mathrm{M}=3.55 \times 10^{4} \mathrm{ppm}$ )

## HARD PACKET 6

Team ID Number:

## Physical Properties

Excess $\mathrm{BaF}_{2}$ was placed in 250.0 mL of 0.50 M NaF and heavy water solution with a density of $1.11 \mathrm{~g} / \mathrm{cm}^{3}$. By how many degrees Celsius was the freezing point lowered by BaF ${ }_{2}$ ?
$\mathrm{K}_{\text {sp }}$ of $\mathrm{BaF}_{2}$ is $1.84 \times 10^{-7}$ Freezing point depression constant of heavy water is $1.86^{\circ} \mathrm{C}$ per molal.

## HARD PACKET 6

Team ID Number: $\qquad$

## Equilibrium

The Symmetry Model of Allosteric Behavior is a model used to describe hemoglobin. Hemoglobin is a four-subunit enzyme whose main function is to bind oxygen. It has two conformations, a low affinity state called Taut (T) and a high affinity state called Relaxed (R). At a given time, all the subunits of a single subunit are in the same conformation, but can switch between the forms as dictated by equilibrium. When no oxygen is bound, equilibrium largely favors the T form. The diagram below demonstrates the conformations of hemoglobin. This interaction is given by the following equilibrium reaction:

$$
R_{0} \leftrightarrows T_{0} ; K_{0}=1.0 \times 10^{5}
$$

Oxygen binding can also bind and dissociate from hemoglobin in an equilibrium reaction. This is given by the following dissociation reaction:

$$
\begin{aligned}
& R O \leftrightarrows R+O ; K_{R}=2.5 \times 10^{-2} \\
& T O \leftrightarrows T+O ; K_{T}=1.0
\end{aligned}
$$

Thus, filling a hemoglobin with oxygen can be modelled by the following diagram:

Recall that equilibrium is a state function. What is the equilibrium constant, $K_{4}$, between $T_{4}$ and $R_{4}$ ? Does this favor the $T$ conformation or the $R$ conformation?

## HARD PACKET 6

Team ID Number: $\qquad$

## Kinetics

Planet X, home to a dizzying number of gaseous molecules, are the subject of heavy experimentation. A common reaction in the atmosphere is shown below:

$$
3 ¥+2 \S \rightarrow 2 \text { Љ } \quad \mathrm{E}_{\mathrm{a}}=47.0 \mathrm{~kJ} / \mathrm{mol}
$$

Another substance deep in the core of the planet, simply listed as $ট$, can reduce the activation energy of this reaction by a factor of 3 . What is the mathematical relationship between the reaction in the core with $\vec{U}\left(k_{2}\right)$ and the reaction in the atmosphere without $\vec{ট}\left(k_{1}\right)$ ?
$\qquad$

## Equilibrium

A 1.0 L solution consisting of $20.0 \%$ propanol $\left(\mathrm{C}_{3} \mathrm{H}_{8} \mathrm{O}\right.$, density $\left.=0.803 \mathrm{~g} / \mathrm{cm}^{3}\right)$ and $80.0 \%$ water by mass is surrounded by an atmosphere with a partial pressure of $10.0 \mathrm{~atm} \mathrm{O}_{2}$, and a partial pressure of $1.0 \mathrm{~atm} \mathrm{CO}_{2}$. Find the reaction quotient $\left(Q_{\partial}\right)$ for this initial mixture, considering the unbalanced chemical equation:

$$
\mathrm{C}_{3} \mathrm{H}_{8} \mathrm{O}(\mathrm{aq})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

(The Henry's law constant for $\mathrm{O}_{2}$ in water is $1.28 \times 10^{-3} \mathrm{~mol} \cdot \mathrm{~L}^{-1} \cdot \mathrm{~atm}^{-1}$, and the Henry's law constant for $\mathrm{CO}_{2}$ in water is $3.1 \times 10^{-2} \mathrm{~mol} \cdot \mathrm{~L}^{-1} \cdot \mathrm{~atm}^{-1}$.)

## Acid/Base

$0.50 \mathrm{M}^{2}$ aqueous solution of $\mathrm{HCOO}^{-}$is allowed to equilibrate at $200.0^{\circ} \mathrm{C}$. Given that the $\mathrm{K}_{\mathrm{a}}$ of HCOOH is $2.95 \times 10^{-5}$ at $200{ }^{\circ} \mathrm{C}, \mathrm{K}_{\mathrm{w}}$ at $200.0^{\circ} \mathrm{C}$ is $4.9 \times 10^{-12}$, and that the following equilibrium concentrations result, what are the pH and pOH of a 0.15 M aqueous solution of HCOOH at $200.0^{\circ} \mathrm{C}$ ?
$\qquad$

## Kinetics

PET Imaging, or Positron Emission Tomography, takes advantage of radioisotopes to image the human body to aid in medical diagnosis. One common substrate used is fludeoxyglucose (FDG), which contains an atom of fluorine-18 $\left({ }^{18} \mathrm{~F}\right)$ and is an analogue of glucose (i.e. it is chemically similar to glucose, a component of sugar). The half life of fluorine-18 is 110 minutes; when the fluorine-18 decays, the FDG molecule is no longer detectable. Once FDG is in the cell, it is phosphorylated by hexokinase through an SN2-like mechanism, and therefore cannot leave the cell. Unlike glucose, however, FDG cannot be metabolized. Neuroscientists observed that glucose (and therefore FDG) is taken up by tumors more quickly than regular tissue. They observed that at some time, $\mathrm{t}=0$ minutes, there is $500.0 \mu \mathrm{M}$ in a tumor cell and $200.0 \mu \mathrm{M}$ in a regular cell of the same type. Then, at another time, $t=157$ minutes, they observed that the tumor cell had 2.0 mM while the regular cell had $600.0 \mu \mathrm{M}$. Assuming the rate of glucose and FDG uptake are the same, what is the ratio of the average rate of glucose uptake between the tumor cell and the regular cell?

## HARD PACKET 8

Team ID Number:

## Physical Properties

Give the full name of the compound and the charge of the ion complexes.
a) $\mathrm{Li}_{3}\left[\mathrm{CuCl}_{3} \mathrm{Br}_{3}\right]$
b) $\mathrm{Ca}_{2}\left[\mathrm{Pt}\left(\mathrm{C}_{2} \mathrm{O}_{4}\right)_{4}\right]$
c) $\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{4}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \mathrm{Cl}$
d) $\mathrm{Na}\left[\mathrm{Fe}(\mathrm{CN})_{2}(\mathrm{OH})_{2}\right]$

## Equilibrium

The EPA has set safe levels of $\mathrm{Ba}^{2+}$ ions in drinking water to be 2 ppm . WUCT's backup dog trainer (Dr. Poupon DeGrasse) wisely spilled enough $\mathrm{BaCl}_{2}$ into his well of initially pure water to raise the concentration to 20.0 ppm . To correct this, Dr. DeGrasse adds some ammonium sulfate to the well, such that the initial concentration of ammonium sulfate is $2.158 \mu \mathrm{M}$ in the well. If the $K_{s p}$ of the precipitate is $1.1 \times 10^{-10}$, what will the resulting concentration of $\mathrm{Ba}^{2+}$ be, in ppm, at equilibrium? Assume that density of solutions is $1.0 \mathrm{~g} / \mathrm{mL}$.

## Acid/Base

Phenolphthalein is a commonly used indicator in titration reactions, which works as a weak base. For phenolphthalein, $\mathrm{pK}_{\text {ind }}=9.3$. However, phenolphthalein begins changing color at a pH of 8.3. If we started with 250.0 ml of pure water, how many moles of phenolphthalein must be added to change the color of the solution?
$\qquad$

## Thermodynamics

A list of reactions is provided for you:

| $\underline{\text { Reaction }}$ | $\underline{\Delta \mathbf{H}^{\circ}(\mathbf{k J} / \mathbf{m o l})}$ |
| :--- | :--- |
| $2 \mathrm{H}_{2}+\mathrm{CO} \rightarrow \mathrm{CH}_{4}+1 / 2 \mathrm{O}_{2}$ | 36.0 |
| $\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightarrow 1 / 2 \mathrm{O}_{2}(\mathrm{~g})+\mathrm{H}_{2}(\mathrm{~g})$ | 286 |
| $\mathrm{CH}_{4}(\mathrm{~g})+\mathrm{CO}_{2}(\mathrm{~g}) \rightarrow \mathrm{H}_{2}(\mathrm{~g})+2 \mathrm{CO}(\mathrm{g})$ | 247 |
| $\mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}(\mathrm{g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ | 41.0 |
| $\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ | 44.0 |

Determine $\Delta H^{\circ}$ of the following reaction:

$$
\mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})
$$

## HARD PACKET 9

## Acid/Base

Consider 50.0 mL of a solution of weak acid, HA, $\left(\mathrm{K}_{\mathrm{a}}=1.0 \times 10^{-6}\right)$ which has a pH of 4.0. What volume of water must be added to change the pH of the solution to 5.0 ?

## HARD PACKET 9

Team ID Number:

## Kinetics

A reaction with a given rate constant occurs at room temperature, $25^{\circ} \mathrm{C}$, with an activation energy of $45.0 \mathrm{~kJ} / \mathrm{mol}$.

In experiment 1 , Peeti raises the temperature of the reaction by $10.0^{\circ} \mathrm{C}$. In experiment 2, carried out at room temperature, Peeti uses a catalyst that decreases the activation energy by 15.0 kJ .

What is the ratio of the rate constant of the reaction in experiment 2 to the rate constant of the reaction in experiment 1 ?
